COVID-19 Vaccines for Children: Exploring Immunization Strategies for Individuals Under 12

During the first year of the pandemic, COVID-19 cases in children were primarily asymptomatic or mild. Children’s infections rose during the delta variant surge in July and August of 2021, leading to more COVID-19 cases and hospitalizations for those under 18. According to the Centers for Disease Control and Prevention (CDC), children and adolescents are four times more likely to be hospitalized in states with vaccination rates under 50 percent compared to those with higher rates. Children with severe COVID-19 may require hospitalization, intensive care or even ventilation. In rare instances, children have died. Like adults, children with underlying health conditions and within communities of color are at greater risk of severe illness. Vaccination can protect the nearly 49 million children in the United States under the age of 12 against COVID-19, especially the risk of severe illness, hospitalization and death. At the time of this publication, a pediatric COVID-19 vaccine is available for children as young as 5.

Since the pandemic began, Governors have been on the front lines, creating and executing policies to strengthen the nation's COVID-19 response. Governors have employed system-wide approaches and innovative procedures to protect health in this and other public health emergencies, such as the H1N1 outbreak. As the nation moves into a new phase of the pandemic, Governors can position their state’s COVID-19 children’s vaccine response to ensure equitable access and increased uptake by:

- Centering all aspects of COVID-19 vaccine response around equity;
- Building COVID-19 vaccine confidence through partnerships and a focus on facts;
- Leveraging existing vaccination infrastructure to meet children where they are; and
- Establishing systems to increase capacity for storage and administration.

CENTER ALL ASPECTS OF COVID-19 VACCINE RESPONSE AROUND EQUITY

Historically underserved populations, including communities of color, noncitizen immigrants and individuals with disabilities, have faced additional barriers to care throughout the COVID-19 pandemic. Black, Hispanic and Asian children have been more likely to be infected with COVID-19, but testing rates are lower among these groups than for White children. People with disabilities, including children and youth with special health care needs (CYSHCN), have been impacted by inaccurate data collection, inaccessible testing, difficulty finding information relevant to a variety of conditions and a lack of alternative text on COVID-19 webpages or closed captions on videos and webinars.

- Black, Hispanic, American Indian and Alaska Native children were hospitalized with COVID-19 three times more often than White children.
- 50 percent of Hispanic parents (compared to 35 percent of White parents) say one of their children fell behind academically as a result of the pandemic.
- Individuals with an intellectual disability are more likely to contract COVID-19 and have six times higher risk of mortality than for those without disability.
Governors, Title V Directors, Health Officers and other state officials may consider the following to center the state’s vaccine response around equity, reduce disparities and prevent additional loss to COVID-19:

- Identify barriers to access for communities high on the social vulnerability index by hearing from community representatives directly and often to address issues in a timely manner.
- Eliminate identification requirements to receive a vaccination to reduce barriers and ensure this is communicated to providers, health care systems and payors in the state.
- Convene a cross-sector council of stakeholders, including leaders from communities of color, disability advocates, community-based organizations (CBOs) and community health workers (CHWs).
- Leverage low-tech strategies to engage families, e.g., partnering with CBOs to set up sites in high-impact areas and allow walk-in options for families to receive vaccines in one location.
- Encourage employers to provide paid-time-off for parents to take their children to get vaccinated for COVID-19 and to catch up on routine childhood vaccinations.
- Urge school districts to host school-located vaccination clinics and allow time for students to get vaccinated during class time.
- Ensure health data collected includes race, gender, language and other cultural factors to identify gaps in service and be able to address them, especially for those facing multiple barriers.
- Provide vaccination materials, including town halls in multiple languages in plain language.
- Create outreach and education campaigns to help individuals understand where and how to obtain the vaccine and that it is available at no cost to everyone regardless of insurance status.

### State and Local Examples

In Connecticut, East Hartford High School permitted eligible students to get vaccinated during the school day through a community health center. The school also provided over 1,000 students transportation to the clinic.

Massachusetts launched a Vaccine Equity Initiative to engage communities hardest hit by COVID-19, build trust, identify barriers and increase access to vaccines.

The Minnesota Department of Health provided information for caregivers of adolescents with special health care needs that includes specifics of what is in Pfizer's COVID-19 vaccine, specific accommodations individuals might request and responses to potential concerns.

New York passed legislation granting public and private employees paid leave to get a vaccine.

The Washington Department of Health COVID-19 Resource website includes resources available in over 50 languages.

BUILD COVID-19 VACCINE CONFIDENCE THROUGH PARTNERSHIPS AND A FOCUS ON FACTS

Preventing the spread of false claims is one of the first steps in building vaccine confidence. False claims about the COVID-19 vaccine have been strategically targeted toward specific populations, like parents, to cast doubt on the vaccine's safety and effectiveness. Governors can lean on trusted messengers who are considered impartial, transparent and consistent to share facts about the vaccine and address peer concerns. For most Americans, especially parents, health care providers are the most trusted sources of information about vaccines. The acceptability of a message is also dependent on the content and context, meaning campaigns are more successful when tailored to a specific audience.

Governors and state officials may consider the following to build vaccine confidence:

- Support peer-led and neighborhood-based opportunities for community conversation through collaborations with CBOs and CHWs.
- Engage pediatricians and specialists early and often to ensure they have the most up-to-date information on the vaccine to share with patients and parents.
- Update media campaigns often to reduce fatigue and capture attention through visuals, emotion, personalized content and/or positive headlines.
- Partner with state and local health departments to develop clear, positive COVID-19 vaccine messaging campaigns that engage a variety of audiences.
- Direct state and local health departments to engage pediatricians and other children's health care providers to develop a network of vaccinators with a consistent message about vaccine safety.

State and Local Examples

The Kansas Department of Health and Environment developed a manual for primary care physicians on creating messages to encourage COVID-19 vaccination.

The Maryland Office of Minority Health and Health Disparities created the Community COVID-19 Vaccination Project (as part of the Maryland Vaccine Equity Task Force) to award grants to 30 CBOs to support vaccine education and outreach. The grants are prioritized to specific zip codes with low vaccination rates.

The Nebraska Department of Health and Human Services created an interactive map called Share Your Shot for residents to share positive experiences about receiving the COVID-19 vaccine.

The North Carolina Department of Health and Human Services partnered with NC Counts Coalition to conduct regional outreach, canvass and provide resources and increase vaccinations among communities of color.

LEVERAGE EXISTING VACCINATION INFRASTRUCTURE TO MEET CHILDREN WHERE THEY ARE

Governors can leverage existing structures, such as Title V departments, and provider relationships to employ strategies to vaccinate children in their states. A large portion of vaccine providers are enrolled in the Vaccines for Children program (VCF), which administers vaccines at no cost to children under 19 years old under certain circumstances like Medicaid eligibility or lack of insurance. These providers have an intimate knowledge of vaccination campaigns due to the number of routine immunizations children require. Engaging VFC providers can also create synergy for catching up on routine childhood immunizations that fell behind during the pandemic.

Children receive vaccines or vaccine information at a variety of locations outside of their doctor’s office, including school health clinics, local health units, pharmacies and clinics through programs like Head Start, Early Head Start or Special Supplemental Nutrition Program for Women, Infants and Children (WIC). State officials can utilize these institutions as well as public health insurance programs, like Medicaid, the Children’s Health Insurance Program (CHIP), and their contracted managed care organizations (MCOs), to connect children and families to COVID-19 vaccinations and increase uptake.

**14% drop in 2020-2021 compared to 2019 in routine vaccine orders**

- **38.3 million** children were enrolled in Medicaid and CHIP (50 percent of total enrollment) as of Jan. 2021
- Medicaid enrollee vaccination rates are **15-30 percent lower** than the general population in some states.
- Over **3 million** 5 – 11-year-olds receive primary health care from community health centers
Governors and state officials may consider the following to leverage existing vaccination infrastructure:

- Leverage **existing structures and provider relationships** to enroll vaccinators, distribute the vaccine and meet children and families where they are for the COVID-19 vaccine and missed routine vaccines.
- Request **providers for CYSHCN** to vaccinate or provide accurate information to patients and families, including audiologists, interpreters, occupational therapist, ophthalmologist/optometrist, physical therapist, speech pathologist/speech therapist and others.
- Engage the **maternal and child health workforce**, including doulas, CHWs and home visitors, to provide factual information about vaccines to their patients and clients.
- Support local health departments holding **vaccination clinics or events** in high-impact settings, including but not limited to kindergarten enrollment, pre-k, **WIC appointments**, Head Start, Early Head Start, after-school programs and other community children’s programs.
- Facilitate collaboration between state and local health departments and the **state child/family services system** to bridge gaps in vaccine access.
- Encourage schools to hold **school-located vaccination clinics** to provide a convenient location for students, family and community members to receive a vaccine.
- Partner with departments of education and school districts to promote vaccine confidence among teachers, school staff and parents by providing **COVID-19 vaccination resources**, asking for their involvement in **school-located clinics**, wearing **COVID-19 vaccination stickers**, displaying **COVID-19 educational posters** and preparing them to address misinformation.
- Collaborate **with Medicaid and contracted MCOs** to reach children and families in areas with low vaccination rates.
- Encourage providers to utilize the state’s immunization information system/registry to facilitate identifying disparities in vaccination coverage for COVID-19 and routine vaccines.

**State and Local Examples**

The **California Medicaid program** (Medi-Cal) linked to the state’s immunization registry to share vaccination information with state MCOs to target outreach efforts to those not yet vaccinated.

The **Kansas Department of Health and Environment** created a detailed **strategy document** for vaccine providers to hold community vaccination events.

The **North Dakota Department of Health** provides an **online survey** for schools to schedule vaccine clinics on-site.

The **Ohio Department of Medicaid** reserves ~3 percent of **MCOs payments from the state** that plans can earn back by improving certain health outcomes, including closing the childhood vaccination gap. The state has also employed vaccine incentives for individuals 12 and older enrolled in MCOs.

ESTABLISH SYSTEMS TO INCREASE CAPACITY FOR STORAGE AND ADMINISTRATION

Initially, the adult vaccine rollout was met with distribution challenges due to cold chain storage requirements, large shipment quantities and expiration limitations. The distribution complexities have eased as cold chain requirements and other barriers have become less rigorous. Although these issues are not anticipated with the pediatric COVID-19 vaccine rollout, special dosing and distribution requirements may cause logistical challenges. Governors can plan to make the vaccine available at many sites, including smaller provider practices, to increase accessibility and offer flexibility.

**Pediatric COVID-19 Vaccination Logistics**

- Pediatric product will have new packaging, new preparation, and a new national drug code; however, the active ingredient is the same.
- The current product for adults and adolescents should not be used in children.
- The packaging configuration will be 10-dose vials in cartons of 10 vials each (100 total).
- Product can be stored for up to 10 weeks at 2 to 8°C (normal refrigeration) and 6 months at ultracold temperatures of -90 to -60°C. Doses must be used within 6 hours once opened.
- Pharmacies participating in the Federal Retail Pharmacy Program (FRPP) will be able to order vaccine to select locations.

Governors and state officials may consider the following to establish systems to increase storage and administration capacity:

- Create a site to break down shipments so providers can receive only needed doses and prevent waste.
- Develop a centralized ordering system for state providers to order vaccines and supplies.
- Adjust existing systems to include COVID-19 vaccine and supply ordering.
